Standard Lore

String theory cannot have continuous global symmetry.

- Gauge theory with $g \ll 1$ indistinguishable from global sym.
- there should be lower bound for *g*.

Claim[Arkani-Hamed,Motl,Nicolis,Vafa]

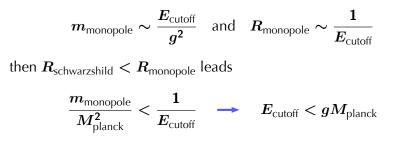

Gravity + U(1) gauge field with c.c. $g \rightarrow$ Extra physics at gM_{planck}

•
$$g_{ ext{grav}} = E/M_{ ext{planck}} < g$$
 if $E < g M_{ ext{planck}}$

• i.e. gravity is weaker than U(1), before new physics comes in.

Motivation behind the Conjecture

- perturbative string compactification $\longrightarrow M_{\text{string}} = gM_{\text{planck}}$
- Simplest monopole should not be black :

• see the original article for more.

◆□ > ◆母 > ◆臣 > ◆臣 > ○ 臣 · ◇ Q @

$\mathcal{N} = 2$ SUGRA and Weak-Gravity Conjecture

Objective

To confirm the scale gM_{planck} in $\mathcal{N}=2$ Yang-Mills + supergravity.

- Why $\mathcal{N} = 2$?
- because we have a lot more control.
 - Everything comes from Prepotential, which is holomorphic
 - Singularity structure (cuts, poles ...) determines the function
- Holomorphy in SW told us a lot about the dynamics of Yang-Mills

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

$\mathcal{N} = 2$ SUGRA and Weak-Gravity Conjecture

Objective

To confirm the scale gM_{planck} in $\mathcal{N}=2$ Yang-Mills + supergravity.

• Why $\mathcal{N} = 2$?

• because we have a lot more control.

- Everything comes from Prepotential, which is holomorphic
- Singularity structure (cuts, poles ...) determines the function
- Holomorphy in SW told us a lot about the dynamics of Yang-Mills

Another Objective

dynamics of $\mathcal{N} = 2$ gravity from holomorphy + monodromy

Behavior of the periods

- $X^1 \sim \epsilon^{1/2} a$, $F_1 \sim \epsilon^{1/2} a^D$
- $X^{2,3}\sim O(1)$, $F_{2,3}\sim \log\epsilon$
- the Kähler potential is then

$$e^{-K} \sim (\log 1/|\epsilon|) + |\epsilon| \operatorname{Im}(a^D)^* a$$

that is

$$K \sim \log(\log 1/|\epsilon|) + rac{|\epsilon|}{\log 1/|\epsilon|} \operatorname{Im}(a^D)^* a$$

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ● ● の Q @

The mass scale of gauge theory I

•
$$X^1\sim\epsilon^{1/2}a,$$
 $F_1\sim\epsilon^{1/2}a^D$ where a,a^D determined from $w+rac{1}{w}+x^2+y^2+z^2-u=0$

• Usually the curve is

$$w + \frac{\Lambda^2}{w} + x^2 + y^2 + z^2 - u = 0$$

$$\rightarrow \epsilon^{1/2} \sim \Lambda = M_{\text{cutoff}} \exp \frac{1}{4} \left(\theta i - \frac{\theta \pi}{g^2} \right)$$
 [Vafa et al.
Let us define $S = \frac{\theta}{2\pi} + \frac{4\pi i}{g^2} = \frac{1}{\pi i} \log \epsilon$

The mass scale of gauge theory I

•
$$X^1\sim\epsilon^{1/2}a,$$
 $F_1\sim\epsilon^{1/2}a^D$ where a,a^D determined from $w+rac{1}{w}+x^2+y^2+z^2-u=0$

• Usually the curve is

$$w + \frac{\Lambda^2}{w} + x^2 + y^2 + z^2 - u = 0$$

$$ightarrow \epsilon^{1/2} \sim \Lambda = M_{
m cutoff} \exp rac{1}{4} \left(heta i - rac{8\pi^2}{g^2}
ight)$$
 [Vafa et al.]

• Let us define
$$S = \frac{\theta}{2\pi} + \frac{4\pi i}{g^2} = \frac{1}{\pi i} \log \epsilon$$

• At which scale *g* is defined ??

(日)

The mass scale of gauge theory II

• Low energy coupling is determined by

$$\tau = \frac{\partial a^D}{\partial a} = \frac{\partial^2 \mathcal{F}}{\partial a^2} = \frac{\theta}{2\pi} + \frac{4\pi i}{g^2(m_W)}$$

• in the weak coupling regime $u \gg \Lambda^2$,

$$a \sim \sqrt{u}, \qquad a^D \sim \sqrt{u} \log u \implies e^{-2\pi^2/g^2(m_W)} = u^{-1/2}$$

• $g^2(m_W)$ is defined at the scale of W-boson, of mass

$$m_W^2 = e^{-K} |X^1|^2 = \frac{1}{\log 1/|\epsilon|} |\epsilon u|.$$

• Thus, the RG-invariant scale is

$$\Lambda_{\text{gauge}} = m_W e^{-2\pi^2/g^2(m_W)} = rac{|\epsilon|^{1/2}}{(\log 1/|\epsilon|)^{1/2}} M_{ ext{planck}}$$

(I) < (I)

The mass scale of gauge theory III

Result.

$$\Lambda_{ ext{gauge}} = rac{|\epsilon|^{1/2}}{(\log 1/|\epsilon|)^{1/2}} M_{ ext{planck}} = e^{-2\pi^2/g^2} g M_{ ext{planck}}$$

• Another nice matching of pure math and supergravity.

Logarithmic periods

• Suppose T_a shrinks at $w + \epsilon^2/w = k_a$ $\rightarrow w_a^+ \sim k_{a'} \quad w_a^- \sim \epsilon^2/k_a \rightarrow$ $\int \Omega = \int_{w_a^-}^{w_a^+} \frac{dw}{w} \int_{T_a} \Omega_{K3} \sim 2c \log \epsilon$

$$rac{\partial \mathcal{F}_{ ext{gauge}}}{\partial \log \Lambda} = u_2 \quad ext{where} \quad u_2 = \langle \operatorname{tr} \phi^2
angle$$

- First noticed by [Matone] for SU(2) using SW curve
- later generalized to classical gauge groups by [Sonnenshein, Theisen, Yankielowicz] and [Eguchi, Yang], using SW curve
- it is built in the instanton calculation [Dorey, Khoze, Mattis] :

$$\langle \partial_{\lambda} L_0
angle = \partial_{\lambda} L_{\text{eff}}, \quad \langle \partial_{\lambda} W_0
angle = \partial_{\lambda} W_{\text{eff}}, \quad \langle \partial_{\lambda} \mathcal{F}_0
angle = \partial_{\lambda} \mathcal{F}_{\text{eff}}.$$

for small ϵ , so that extra cycles are at finite values of x, y, z• one can calculate X^a, F_a perturbatively in $\epsilon^{i/h}u_i$.

- they have $\log \epsilon$,
- but all u_i dependence is analytic in $\epsilon^{i/h}u_i$.

Proof.

i.

Let us prove

$$rac{\partial \mathcal{F}_{ ext{gauge}}}{\partial \log \Lambda} = u_2 \longrightarrow rac{\partial^2 \mathcal{F}_{ ext{gauge}}}{\partial u_j \partial \log \Lambda} = \delta_2^j.$$

First, rewrite LHS :

$$= \frac{\partial}{\partial u_j} \left(2\mathcal{F}_{\text{gauge}} - \sum_i a^i \frac{\partial \mathcal{F}_{\text{gauge}}}{\partial a^i} \right) = \sum_i \frac{\partial a^i}{\partial u_j} a_i^D - \sum_i a^i \frac{\partial a_i^D}{\partial u_j}.$$

e.

$$\sum_{i} F_{i} \frac{\partial X^{i}}{\partial u_{j}} - \sum_{i} X^{i} \frac{\partial F_{i}}{\partial u_{j}} = \epsilon^{2/h} \frac{\partial^{2} F_{\text{gauge}}}{\partial u_{j} \partial \log \Lambda} + O(\epsilon^{3/h})$$

Proof.

• Consider the transversality condition

$$\sum_i F_i rac{\partial X^i}{\partial u_j} - \sum_i X^i rac{\partial F_i}{\partial u_j} = -\sum_a F_a rac{\partial X^a}{\partial u_j} + \sum_a X^a rac{\partial F_a}{\partial u_j}$$

which came from $\int_{CY} \Omega \wedge \partial_{u_j} \Omega = \mathbf{0}$.

- X^a , F_a analytic in $\epsilon^{i/h}u_i \longrightarrow \text{RHS} = \text{const} \cdot \delta_j^2 \cdot \epsilon^{2/h} + O(\epsilon^{3/h})$
- F_a contain $\log \epsilon$, but they should cancel in RHS
- DONE !
- const fixes the proportionality factor between u_2 in CY and $\langle \mathrm{tr} \, \phi^2 \rangle$

Comments

- First proof for *E*-type gauge groups.
- Known proofs for classical gauge groups similar : there, SW differential has a pole at infinity of the SW curve.
 - → Riemann bilinear id. leads to

$$\sum_{i} \frac{\partial a^{i}}{\partial u_{j}} a^{D}_{i} - \sum_{i} a^{i} \frac{\partial a^{D}_{i}}{\partial u_{j}} = \text{contribution from the pole}$$

- cycles at finite $\tilde{x}, \tilde{y}, \tilde{z}$; poles at infinite $\tilde{x}, \tilde{y}, \tilde{z}$ \iff gauge-theory cycles at infinitesimal x, y, z; extra cycles at finite x, y, z
- for exceptional gauge groups, the curve is not hyperelliptic
 horrible poles ! which prevented the proof.
